# Educational BBC due for a caning

MIKE COWLEY reporting

CAN you keep a secret? Well the gossip is that the long standing affair between Miss UK Education Establishment (128k-64k-128k) and live-in lover BBC Micro is heading for the rocks. Apparently – and only *Atari User* and Nigel Dempster are privy to this – she is secretly being wooed by a number of alternative suitors.

There is little doubt that they are influenced by her money – it being a case yet again of never mind the boat race, clock the purse. And no doubt this accounts for the almost indecent bodice-ripping haste involved in the chase.

It will all be to no avail however, for I can now exclusively reveal that she only has eyes for the latest star to appear on the circuit – Mr ST himself.

By carefully projecting his power without the price, he is reported to have already successfully swept her off her feet. The latest titbit is that she'll be booting out rather than up her elderly BBC Micro any day now. But as one wit observed, with his limited memory it shouldn't be long before he's forgotten it any way.

But what do I base all this (nonsense) on? Well the signs are there for all those who are prepared to look. The boys from Acorn have for too long now considered their educational market position unsatisfactory, just as the French did behind the Maginot line.

The trouble was they failed to notice the longing glances being cast by Atari since the Trelmel clan replaced the corporate backbone in the company. Now it may be too late for them to counter attack against the rapid advances Atari has made in this sector of late.

Cleverly deciding to catch Acorn off guard by attacking the top end of the market, Atari launched a pincer movement on the university front.

The company's first breakthrough came when G & B Computer, a London dealer, landed an order for 60 520STMs from City University where the machines will be used to teach programming skills. Only days later, the redbrick University of Sussex fell under the ST onslaught of Brighton Computer Exchange.

And now Atari is knocking loudly on the door of the Open University with a tender for 30,000 computers. With the OU having made it a criteria that any computer bought must be MS/DOS compatible, Atari was able to play its IBM add-on trump-card.

The advantage with this is that we are both PC/DOS and MS/DOS compatible", says Atari UK boss Mark Bambridge with undisguised glee. "So with our product more than fulfilling their requirements and at our price, we must be in with a real chance at public tender. With this one under our belt, it won't be long before the ST is the required norm in the UK education scene".

If that wasn't enough to turn the Acorn boys into lemmings, then Atari had to give them a further prod

by coming up with a BBC emulator. Written by a freelance programmer, it runs standard BBC Basic at the same speed as the Acorn machine.

It's no wonder that some people at Acorn are growing increasingly concerned that this time it may be the Master that's in for a caning.

★ ★ ★

*If you happen to have a friend who has paid out a far larger sum of money for an IBM PC or an Apple II than you have for your ST, try dropping in this little gem at some convenient moment.*

*Systematics International has recently put its popular accounts suite on the 1940ST. It now turns out that the Atari version runs at three times the speed of its IBM PC counterpart and eight times faster than the one for the Apple II.*

★ ★ ★

THE ST is increasingly looking better value for money. It all boils down to the price of the first class software now being made available for the machine.

For the 520ST in particular, it would be little short of ridiculous to fork out up to £500 even for such well known packages as dBase II from Ashton Tate. But ST users don't have to because VersaSoft has come up with dbMan to do the job at just £170.

And for those who long for the Gone with the Wind of programming – Lotus 1 2 3 – there is the compatible VIP package for the ST which costs less than £200.

★ ★ ★

*LOOK out for a new super-chip designed to rival the graphics blitter found at the heart of the Commodore Amiga. It is currently being worked on under maximum security at Atari before release in a new ST model later in the year.*

*Nothing more on the forthcoming machine yet apart from the fact it will have 2mb of memory and will probably not appear before the end of this year.*

★ ★ ★

A "CLEANED up version" of Atari's CP/M emulator for the ST is being offered by a dealer down in Essex. The man behind the product – it costs £9.50 including post, packing and VAT – turns out to be former Atari employee Mike Wilding.

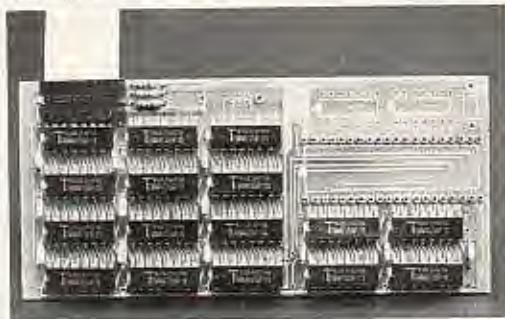

It includes one CP/M emulator disc, a utility disc incorporating public domain software and a 14 page manual. The latter is said to overcome "the usual Atari problem" – having the instructions for using the disc filed as a document – on the disc.

# Upgrade the 520 ST to one megabyte and add the professional look from under £100!

## MEMORY CARDS

The AST-520 MEMORY CARD upgrades the standard 520 ST to ONE MEGABYTE of RAM, and costs under £100 inclusive of VAT! The AST-2080, goes even further, brings the RAM to TWO AND A HALF MEGABYTES for less than £200 inclusive!

Now, really big RAM DESK — as big as a double-sided disc drive, computers that can crunch thousands of lines a minute, megabyte long documents, huge spreadsheets and useful databases with thousands of records in memory become practicable.

## DISC DRIVES

AST Disc Drives are all 80 track double-sided, offering 720K (one megabyte unformatted) — TWICE the storage capacity of the standard ST drive. They are available in 3.5 and 5.25 inch formats. The drives are easily chained to the standard ST drive, using the power and data cables supplied.

## SYSTEM CASES

You can give your ST a really professional look with the AST SYSTEM CASE. It can hold two 3.5 inch, and one 5.25 inch floppy drives, or a Winchester drive together with the ST power supply units.

1 CASED ATARI DRIVES; 2 UNCASED 3.5" DRIVES

## PLYNTHS

In two styles as per system cases.

for the

## Atari ST

**DIRECT FROM THE UK's SOLE DISTRIBUTOR**

The MEGAMAX C is probably the best C development system available for the ATARI 520 ST. Already voted as the best C system for the APPLE Macintosh, the new ATARI package is even better, packed with even more features and now available at a very realistic price tag of just £137 (ex VAT).

- This package is a complete development system, not just the compiler and common IN/OUT library. Take the Graphical Shell for example. MEGAMAX fully supports all GEM routines (AES, VDI and DOS).
- Full Resource Construction routines (MENUS, DIALOGUE BOXES and ICONS).
- Increases speed of correcting, altering and re-running programs by up to SIX times compared to other C development systems.
- AS&T will provide full support to all their REGISTERED customers and dealers (including PRESTEL mailbox for queries and replies).
- Library source code Listings available.
- Subject to sufficient user support there will be a newsletter and additional library routine source disc service.

MEGAMAX C development system including 400+ page manual plus system and utility discs.

## QA

ONE of the many problems facing users who buy their computer early in its life is the lack of quality programs and reference books. Programs allow users to get the most from their new machines, whereas reference books help them answer some of the many questions that they might have about their new purchase.

One of the first books to arrive for the ST is *Harnessing The Power Of Your Atari ST* by Tim Hartnell. It is well presented with many illustrative screen dumps and examples. However it is the overall content which lets the book down.

Mr Hartnell has split it into three main sections - Using the GEM desktop, Using Logo and Using GEM Draw. The first section describes how to manipulate such things as files and folders, but fails to say anything which isn't already covered in detail in the ST handbook supplied with the machine.

The Using Logo section is made up of some 90 pages which serve as a useful introduction for the beginner. It is well laid out with plenty of examples, supplying some information which isn't in the Logo handbook supplied with the ST and some information that is hidden deep within the handbook. It is a good introduction to Logo.

The final section explores the use of GEM Draw from Digital Research. This is also well presented with many helpful examples which would be advantageous to all owners of GEM Draw. The question is, how many people actually own this piece of software? Certainly you would not expect the first time user to buy such a product.

This book contains much well thought out material, but it is a pity that there is so little material which isn't already supplied in various manuals. This book would be useful for absolute beginners, but even they would probably outgrow it fairly quickly.

I'm sure that we'd all rather wait a couple of months longer for our computer books, so that the authors can include information which isn't already supplied in the handbooks. After all the passing of information from the author to the reader is what a book is meant to do.

## Problems, problems.

THERE have been lots of new and varied problems this month. Malcolm Crowe from Glasgow asks where he can obtain the AES and GEM manuals that I mentioned a couple of months ago.

These manuals are part of the Atari software developers' kit. They are not intended to be used by non-software developers and are highly technical and generally user-unfriendly. Another minus is the fact that the developers' kit costs over £300.

All of the information in the manuals is now available in various books from third party

# Facts are well worth waiting for

publishers, such as 1st Publishing and Compute. I hope to obtain copies of these and shall tell you my views on them soon. (See also this month's *Book Reviews* on Page 11.)

Alan Philips writes from London N9 to ask if the 1040ST is available without a monitor. Alan already has a colour monitor and is trying to save some money by not ending up owning two of them.

If you really need a 1040 without monitor you're probably better off buying a 520STM, adding a double sided disc drive and expanding the memory with a board of the kind that AST sell. This will probably end up cheaper than a 1040 as well. Failing that, if you still desperately want a 1040 you may find a dealer who will split a 1040 package and sell it without monitor.

Alan also wants to know if it's safe to place his disc drives directly under the monitor. The Atari monitors have very high magnetic fields directly around them which can corrupt a disc and therefore make files unusable, causing many hours of work to be lost. For this reason you mustn't store your discs close to your monitor.

The disc drive is shielded against outside fields and so you shouldn't have any problems placing it near your monitor. That said, you won't find my drives anywhere near my monitor. It just isn't worth the risk. It's like storing valuable papers next to a raging fire - one small breeze and up go hours of work.

M. Morgan from Balearas, Spain, asks why the control panel date and time are reset every time he switches on his ST. Unlike the Apple Macintosh the ST doesn't have a built-in battery to keep the clock running when your ST is turned off.

It is possible to build a battery clock circuit for your ST, but if you're not that confident with electronics you might consider buying AST's clock card. This keeps the clock running, so that it's always correct when you turn on your ST.

Mr Ong from Singapore writes to complain that my method for auto running programs using an Auto folder doesn't work. Unfortunately any program that is placed in an Auto folder will be executed before the ST has properly initialised GEM.

This means that GEM isn't available to any program that you place in one. Only programs

# SOFTWARE FOR THE ATARI ST

## ►MCC ASSEMBLER

**£49.95**

A professional quality macro assembler with many useful features for the serious programmer. Standard Motorola 68000 mnemonics. Macro expansions. Over 160 explicit error messages. Fully formatted listings. Large range of directives. Includes the source of a simple debugger. The macro assembler chosen by Commodore for the Amiga.

**MENU+ ► NEW! ◀**

**£19.95 ON ITS OWN**

**FREE WITH ANY METACOMCO LANGUAGE\***

MENU+ provides ST users with a friendly environment to control their programs, using pull-down menus and the mouse. Easy-to-use. Runs single programs or batches, avoids repetitive command line entry. The user can add his own tools, arguments and options. Runs any programs - not just Metacomco products.

## ALL METACOMCO PROGRAMMING LANGUAGES FOR THE ST HAVE THESE ADVANTAGES-

### ► INTEGRATED RANGE OF LANGUAGES ON THE ST AND OTHER 68000s

Metacomco's range of languages for the ST provides an integrated and consistent programming environment for ST programmers. Program modules written in different languages can be linked together. Metacomco's ST languages are compatible with their languages for Amiga and QL. Make it easy to port your programs by choosing Metacomco.

### ► GEMDOS LIBRARIES (Source code provided)

All Metacomco languages come with a set of GEMDOS libraries, making it easy to program the graphics and the other features of the ST. Full source code of all GEMDOS libraries is provided, allowing programmers to modify them. The source code is well documented.

### ► CHOICE OF LINKERS

All Metacomco languages include a linker. Metacomco program modules can also be linked using the Digital Research linker.

### ► FRIENDLY ENVIRONMENT

All Metacomco languages now include MENU+, an easy-to-use programming environment using pull-down menus and the mouse.

### ► SCREEN EDITOR

A powerful screen editor for preparing programs is included with every language.

### ► DETAILED MANUAL

Every Metacomco language comes with its own detailed manual.

\*EXISTING REGISTERED USERS CAN OBTAIN AN UPGRADE INCLUDING MENU+ AT A SPECIAL PRICE. PLEASE CONTACT METACOMCO DIRECT.

AU

that don't use GEM, such as STWriter and some RAM discs, can be auto run in this way. You can place as many programs in an Auto folder as you like and they will be executed in the order in which they were placed in.

Mr Blackwood from Manchester is worried over software compatibility between the various ST models. The ST series is what is known as upwardly compatible.

This means that anything written for the 520ST or 520STM will run on a 1040, but anything written for the 1040 might not work on the smaller machines. At the moment, there is very little software that requires the 1040's extra memory, so you shouldn't have any problems with software compatibility.

Brett McBain from Petworth, Sussex, has just upgraded to a ROM system, and is having problems using the control panel. If you try to boot the system using your old System Disc the old system will be loaded in as before, and you will lose 200s and have all of the old bugs.

To avoid this problem you should move the disk accessories and DESKTOP.INF file onto a new disc. You can then use this disc whenever you want to boot the system. Another method is to place the accessories and DESKTOP.INF on all your discs, so that you can simply boot with

any disc.

The ROM system also allows you to rename your accessories, as long as they still have the .ACC file extender. Therefore you can rename the supplied accessories to help you remember which accessory file contains which accessories. For example you can rename DESK1.ACC to CONTROL.ACC and DESK2.ACC to EMULATOR.ACC, as Atari has done on the more recent discs it has shipped.

My thanks to Andrew Davidson who informs me that it is possible to reverse the display on a hi-res monitor. This is done by moving the control panel sliders to their bottom position. Having a reverse display may be preferred by some and it certainly makes Megaroids look more interesting.

We at Atari ST User Towers would like to know what languages you have. For example, are there enough of you who own a C compiler to start publishing C listings? In order to answer this problem we need your help.

If you write to me to ask for help on any subject I would also like you to tell me what languages you own and what you think of them. I'll be publishing the results in a couple of months and hopefully your answers will help mould the magazine to your tastes. ■

**Title:** *The Anatomy of the Atari ST*  
**Authors:** Gerits, Englisch, Bruckmann  
**Price:** £12.95  
**Supplier:** First Publishing, Unit 208, Horseshoe Road, Horseshoe Park, Pangbourne, Berkshire RG8 7SW. Tel: 07357 5244

AT last books are appearing that begin to delve into the internal mysteries of the ST operating system and to supply information not previously available in this country. With this book you can know at a single stroke more than Atari HQ's Hotline does.

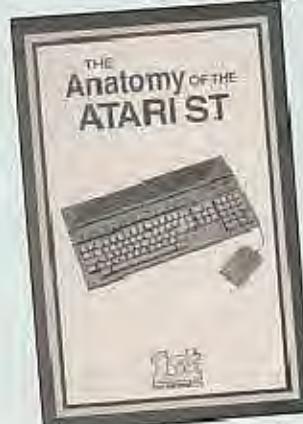

Its 446 pages start by looking at the ST's hardware, then move on to cover the various software routines available. It is very much like the Advanced User Guide for the BBC Micro in the areas covered.

The hardware sections explain the ins and outs of the 68000 processor, WD 1772 floppy disc controller, MFP 68901, 6850 ACIA's and YM-2149 sound generator. Also examined are the keyboard and its controller, joystick ports, and all the other sockets on the ST's outer case.

Each item is given a circuit diagram with the various pins named, and background information on the registers used and the commands available to program it. The keyboard control routines are especially useful, allowing you to control the joysticks and mouse.

Perhaps the most useful section for the ST machine code programmer is the software section. This starts by looking at GEMDOS and all the different machine code calls available. Each command is described in detail with examples given where necessary. Since GEMDOS controls input/output routines and disc operations it is a powerful tool to acquire. BIOS (Basic Input Output System) and XBIOS are described in much the same way, in some cases overlapping with GEMDOS in function. Routines included in this section include calls to control the MIDI and RS-232 ports, and random number generators.

The next section is all about the Command

Stephen Underwood reviews two books on the ST

## Mysteries no longer..

Line A Interpreter - a grand title for something that is a quick way into the vastly complicated graphics system. Fifteen routines are listed, and these allow you to do such things as redefine the shape of the mouse, draw software sprites and lines, fill in simple graphic shapes and move blocks of memory around. A few more examples might have helped the reader to understand all that was going on here.

Exception vectors and interrupts are covered next. For anyone who fancies writing machine code routines to handle text, the VT52 emulator section is a must, with its listing of each text controlling routine.

The final two informative sections list all the useful memory locations plus a brief explanation of programming the 68000 processor. The former section gives the locations of such useful items as the start of free memory, start of screen memory and the system clock.

The remaining 80 pages give a complete breakdown of the BIOS listing. This section seems an excuse to pad out the book as it is useless to me as a programmer. It is quoted in the book as being valuable, but not why it is so. I have yet to find a use for it.

**Verdict:** A superb book, aimed at anyone who wants to delve further into machine code and use the routines that the system supplies. This is the book I have been waiting nearly six months for.

## The inside story of GEM

**Title:** *GEM on the ST*  
**Authors:** Szczepanowski and Gunther  
**Price:** £12.95  
**Supplier:** First Publishing, Unit 208, Horseshoe Road, Horseshoe Park, Pangbourne, Berkshire RG8 7SW. Tel: 07357 5244

GEM is the built-in software on the ST that controls such things as the text windows, drop-down menus and the mouse. It also controls a host of graphic drawing routines and text presentation. This book describes GEM in detail then goes on to look at each of the various GEM calls in turn.

As such it is vastly useful, supplying

information which is normally contained in the £325 GEM manuals, but is not so easy to use because none of the routines are written in Basic.

What the book does cater for is the machine code and the C programmers. However I should say at once that while the C programs work fine, I have yet to get one machine code program to do anything at all except produce errors with my assembler.

It would appear that the key initialising routine was either written for an earlier version of GEM or contains a fatal error somewhere in its listing. This is frustrating since I bought this book to use at the machine code level.

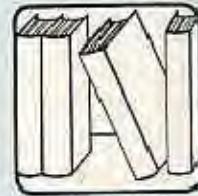

It starts by looking at GEM in an overview, and its two major divisions, the VDI and the AES, then goes on to explain how to use the programs in C and in machine code. This is fine, but the machine code section is not too clear and both explanations assume that you are in possession of the £1000 plus software package issued to software houses when the ST first came out. Rather a limited audience to aim at I would have thought.

Next come two massive sections describing

all the VDI (Virtual Device Interface) and AES (Application Environment System) routines. Each is described in detail, the various variables used are listed as well as the information needed to include each routine in 68000 and C calls. In addition some complex examples are given at the end of each section explaining briefly what each routine does and what should result.

I feel that as a source book of information on the GEM calls this is hard to beat, but lets itself down on that most important of areas explaining to Joe Public how to use those routines himself. ■

the software supplies company

spouse, job, or children. Income, spending, problems, and so on, are not the only factors that influence a person's well-being. The way a person perceives his or her life situation is also important. For example, a person who is physically healthy but who perceives his or her life as being "terrible" is likely to experience poor health. Conversely, a person who is physically healthy but who perceives his or her life as being "good" is likely to experience good health. This is because the way a person perceives his or her life situation influences the way he or she reacts to it. For example, if a person perceives his or her life as being "terrible," he or she is more likely to react to stressors in a negative way, which can lead to poor health. Conversely, if a person perceives his or her life as being "good," he or she is more likely to react to stressors in a positive way, which can lead to good health.

the first time in the history of the world, the people of the United States have been called upon to decide whether they will submit to the law of force, and let a single human being live, or to the law of the Constitution, which guarantees to every man his life, his liberty, and his property.

## TCL Special Packages

**ATARI**  
Power Without the Price™

**TCL 1**  
520 STM Computer with 500k Disk Drive and High Res Monochrome Monitor £675.00

**TCL 2**  
520 STM Computer with 500k Disk Drive and Medium Resolution Colour Monitor £775.00

**TCL 3**  
520 STM Computer with 1 MBYTE Disk Drive and High Res Monochrome Monitor £835.00

**TCL 4**  
520 STM Computer with 1 MBYTE Disk Drive and Medium Resolution Colour Monitor £745.00

**TCL 5**  
1040 STF with built in 1 MBYTE Disk Drive and High Resolution Monochrome Monitor £790.00

**TCL 6**  
1040 STF with built in 1 MBYTE Disk Drive and Medium Resolution Colour Monitor £950.00

All TCL Packages come complete with all interconnecting cables and are supplied with ST Basic, ST Logo, and 1st Word

## Printers

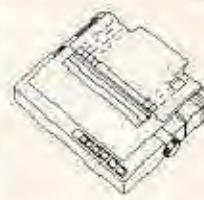

**CITIZEN 120 D**  
This new citizen 120D with 120 CPS and 25 CPS NLQ comes with tractor and friction feed as standard. IBM and Epson Compatible with TWO years Warranty £159.00

**CITIZEN M580**  
The new citizen M580 with 160 CPS Draft and 40 CPS NLQ. With TWO years Warranty £259.00

**BROTHER M1109 NLQ**  
Printer 100cps. Directional Logic Seeking Friction feed and secondary optional tractor feed £189.00

### NEW

**STAR NL-10**  
Firm Near Letter Quality, 100% compatibility and total reliability all in one easy to use printer. For quality, ease of operation and dependability, nothing beats the Star NL-10. You get outstanding print quality at 125 cps in draft mode and 30 cps in near letter quality. Plus, the sleek NL-10 can be connected to virtually any popular computer through plug-in interface cartridges. Just insert the appropriate cartridge and interface cartridge for your IBM-PC, Commodore, Apple IIc or other parallel computer and your Star NL-10 is ready to print. Touch a button on the control panel to set the print pitch (characters) to either the typewriter pitch or in either draft or NLQ mode. You can even set left and right margins, make top of form settings and control forward and reverse feed in the easiest of ways. £229.00

**EPSON LX80**  
With 100 CPS draft and 16 CPS NLQ and optional tractor or sheet feeder. This printer has a standard parallel connection and accepts all other Epson serial Parallel boards with external dip switches for easy access and internal EP ROM buffer. It offers a high specification at a low price. £229.00

**EPSON LQ800**  
24 Pin Dot Matrix Printer offers a high 200 CPS draft speed and near letter quality at 67 CPS with high resolution graphics and a variety of fonts. £355.00

**ALSO AVAILABLE**  
Epson FX 85 £365.00  
Epson FX 105 £495.00  
Seikosha GP 58A (Parallel) £69.00  
Seikosha GP 58B Inc. Printer 8F + cables £89.00  
Canon PW 1080A (NLQ) £249.00  
Canon A55 £379.00

**DAISYWHEEL PRINTERS**  
QUENDATA DWP 1120 with optional tractor/sheet feeder and 13" paper width facility.

This Daisywheel printer with 20 CPS has 96 character print head compatible with the QUME. Standard centronics interface. optional RS232 C) £169.00

Brother HR 15XL £389.00  
Juki 6100 £285.00  
Juki 2200 £275.00  
Juki 6300 £799.00

# A Basic route to 3D drawings

By GRANT OWEN

MANY simple drawing and doodling programs have been written for the ST. Now here is a short Basic one which will allow you to draw a shape and then convert it to 3D, even allowing you to look at it from varying angles.

Type in the listing, and save a copy on disc. When you run it simply follow the instructions on screen. To define the shape point the mouse and click on the left button. Now move the pointer to the next point you require, and press the button again.

Continue this process until you have finished your flat design – see Figure I – and then press the right button. You will then be asked how many faces you require the finished drawing to have. The maximum allowed is 50, which gives a very well defined circular drawing effect.

When all the calculations have been done the next question is the angle of view. Figure II shows the half-drawn shape with an angle of 0.5 selected, and Figure III shows the completed drawing. Figure IV shows the same design, but with an angle of 0 – in other words a cross-sectional view.

The program was written on a monochrome monitor, but should work in the colour modes by reducing the 320 offset value – see lines 770-790, for example.

Figure I

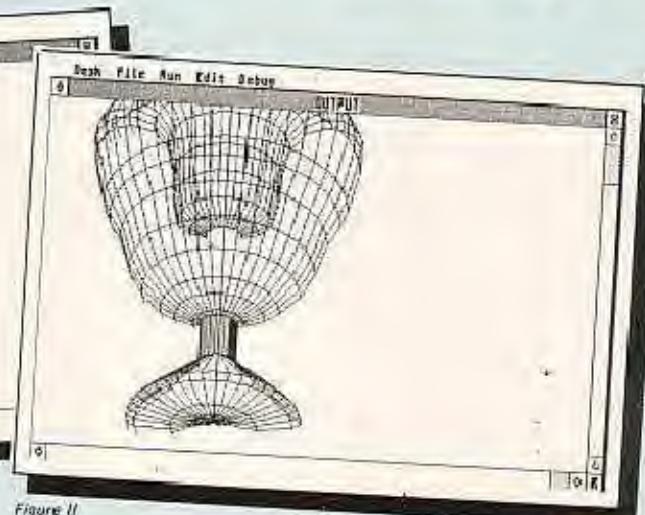

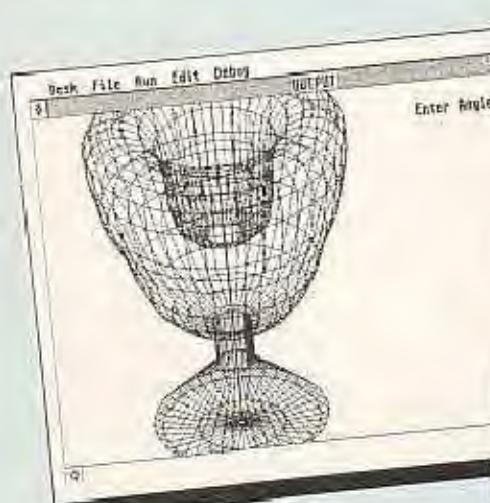

Figure II

新編卷之三

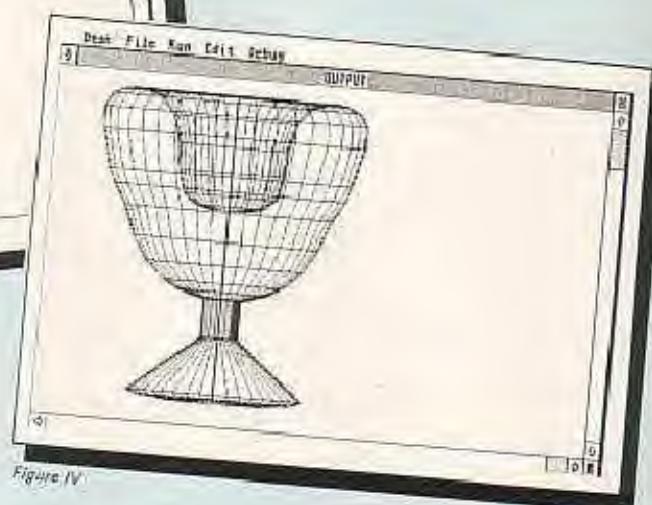

Figure 11

# The new 1M With a memory like we haven't for

Internal power supply.

Resolution: 640×400 pixel  
in monochrome or 320×200  
with 16 colours,  
640×200 with 4 colours.

TOS in ROM creates  
a workspace of over  
900K bytes.

Monitor: 12" high-  
resolution monochrome  
or 14" colour.

Integral 1Mb  
(unformatted)  
double-sided  
3½" disk drive.

94-key QWERTY keyboard  
with numeric keypad  
and cursor controls.

The price! Under £1  
a Kb (excluding VAT),  
including colour monitor.

An enormous 1024K RAM plus  
a powerful Motorola 68000  
processor running at 8MHz.

Port for mouse  
or joysticks.

Two-button  
mouse.

# 1Mb 1040STF

## that you can be sure you haven't forgotten a thing

The Atari 1040STF employs state of the art 16/32 bit technology. Yet its price is unbeatable.

The ST range of computers already has a large number of software programmes available, including word processors, spreadsheets and databases, as well as a variety of programming languages and specialist business packages.

The 1040STF will also run software written on several other popular operating systems, including CP/M.

It has a 1024K RAM, integral 1Mb (unformatted) double-sided 3½" disk drive, two-button mouse and built-in power supply.

The operating system is in ROM, leaving RAM free for applications. BASIC and LOGO programming languages complete the package.

With 12" monochrome monitor, we recommend it sells for £799 excluding VAT saving you at least £1600 against its nearest rival. The price of our 14" colour system is a remarkably low £999 excluding VAT.

As the American magazine 'Byte' commented, "for some time to come the 1040STF will be the clear leader in price/performance."

For the name of your nearest dealer, ring Teledata on 01-200 0200.

## And that includes an unbeatable price

 **ATARI**  
Power Without the Price™

## Scoop from Japan

ONE of the first reports of the arrival of Prince Charles and Princess Diana in Japan on their recent visit, came direct to the UK from a MicroLink subscriber, beating some of the international news agencies to the punch.

Journalist Yuichi Ishikawa timed his message 12.00 BST, 8 May 86, with the subject matter in capital letters: "WELCOME ROYAL COUPLE TO OUR COUNTRY".

He even took time to design on his terminal two flags – the Rising Sun of Japan and the Union Jack.

His message read: "I Japanese subscriber of MicroLink honour to report the Royal Couple from UK landed safely at Osaka International Airport now. We are pleased their visit. Weather: fine. Temp. 70 degF."

"She wear white one piece. Grandson of Emperor, Hironomiya, meet at airport. Today they will stay Kyoto, beautiful old capital of Japan. I wish they see not only traditional Japan but also High Techs."

"Now weather is getting rainy. Did they come with bad weather of England?" he joked.

## Exporters pick MicroLink

ONE of Britain's leading import-export organisations has chosen MicroLink as the communications medium for its near 10,000 members around the world.

The prestigious British & Overseas Institute of Import Export Traders is a totally non-profit association run solely by its members who volunteer for election as officers.

It was founded in 1972 by a group of small companies and individuals who pooled their resources and knowledge to start a joint export sales drive to promote their respective products in Europe.

From this small beginning the Institute has grown to be a highly respected organisation with members all over the world.

"As its main function is to bring exporters into contact with overseas importers, it is a logical progression to require a quick and efficient standard means of communication", a spokesman said.

"As a result of this requirement the products and services committee of the Institute recommended all members to start using electronic mail".

Bill Vickerman, chairman, and Bob Pinder, senior

exports consultant – both based in Liverpool and already MicroLink users – said they chose MicroLink because it was reasonable in cost and highly effective in its means of communicating with members.

"It is a quick means of spreading the information that our members need to conduct their business efficiently", said Mr Vickerman.

"It is also a British service that is constantly bringing out new and better means of communication and in its way is a vital aid to our continual search for further British export trade".

## Key in for world's hotels

*MORE good news about the International Official Airline Guide, which was added to MicroLink's growing list of value added services last month:*

*As well as supplying the very latest data from more than 750 airlines worldwide – with details of 1½ million flights – and ensuring trouble-free and more economical flight arrangements, OAG also takes the strain out of choosing a hotel at the other*

*end of your journey.*

*The same source that provides you with unbiased, up-to-date flight and fare information now brings a world of hotel and motel listings to your computer terminal.*

*Through the medium of MicroLink you can press a few keys and view over 17,000 North American hotels, more than 9,000 in Europe and 3,000 in the Pacific area.*

*You simply tell the OAG Electronic Edition the city you're going to and the location you prefer – near the airport, downtown or in a nearby suburb or resort – and in seconds you get a comprehensive alphabetical listing of hotels and motels in the location you've selected.*

*These come complete with name, address, telephone numbers, range of room rates, and quality ratings.*

## Opening the golden door

MEMBERSHIP of MicroLink doesn't just mean access to its broad range of communications and other value added services. It also opens the door to a wealth of information on the host Telecom Gold system.

The main MicroLink menu

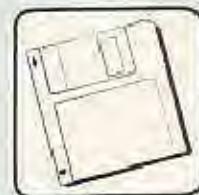

makes it simple to dial up the many fascinating databases on Telecom Gold.

Latest addition to the list is World Reporter, a massive full-text database of international news, current affairs and business information, operated by Datasolve.

Its sources include some of the world's leading news gatherers including the Financial Times, Washington Post, The Guardian, The Economist, New Scientist, News Service of Japan, TASS from the USSR and the BBC.

# C A language to harness the ST's sophistication

**THE ST is here to stay, and with it comes computing sophistication with an immense potential to unleash the power of professional computing languages to the home user.**

"So what?" I hear you say, and the answer is that applications which seriously attempt to tap even part of the ST's power will have to use a language which lets it off the leash.

This is where C comes in. It is a structured language of great power used to write a huge range of software, including operating systems, interpreters, databases and even Megaroids. Importantly for us, Gem and TOS routines for the ST are documented in C. More important still, software written in C has greater portability to another machine than if a Basic or 68000 assembly language were used.

Need more convincing? Think about this – portability is saving us money right this very minute. Why? A lot of the languages now available for the ST are existing packages for other machines. Stuff that runs on a 68000 in a Macintosh will run on an ST with very little juggling. Even software for the IBM will transport across to the ST as long as it is written in a portable language like C and it isn't hardware-specific.

And here's the payoff – all those Macintosh and IBM users paid up to £300 or more for their software. That means the publishers have most likely got their program development costs back before they arrived on the ST market and can thus make the ST price lower – and lower still, because how can you charge IBM rates for an Atari-priced bundle that throws in free software?

With software charges held in check by low hardware costs the era of inexpensive but powerful software has arrived. There are lots of cheap goodies on the way.

This review is of three C compilers – from Digital Research (as supplied with the ST Development Pack), the Cambridge company GST, and Lattice C from Metacomco. Unlike interpreters – the Basic in most micros is an interpreted language – they need to have source code written, then compiled in one or more steps and then linked to a library of ready-compiled

routines for those functions frequently used.

The result is a program locatable anywhere in memory which you find as a .PRG file on your ST discs. This process is called development and it is gone through many times in arriving at a new piece of software. In looking at compiled languages you need to know how close to the language standard it gets, how easy it is to compile, how small the .PRG module is and how fast it runs.

The latter is familiar as a benchmark time, but shouldn't be looked at in isolation – compilers that produce faster times than others sometimes need more memory and more patience during development.

I've tried to compare all these factors for the products under review in such a form that comparisons may be made with the performance of compilers on other machines. Purists argue

```
*****
/* start */
*****
long ticks, *ticks = 0x4B0;
printf("\nPress a key to start");
getchar();
SuperIO();
time = *ticks;
```

```
*****
/* end */
*****
time = *ticks - time;
SuperIO();
printf("\nTicks = %d", time);
printf("\nPress a key to exit");
getchar();
```

```
*****
/* empty.c */
*****
#include "stdio.h"

main()
{
}
```

*The 'Start' and 'End' source files, plus a null statement program to test the compiler's overheads*

**Peter Connors reviews three C compilers**

that benchmark results aren't comparable because, for example, one version of C might use a 32 bit value for ordinary integer variables where another uses a 16 bit value, but I've used the default size of int for the C under test.

This was 32 bits for Lattice and GST but 16 for DR, giving it an advantage in those tests where variable length is important. I've tried to point out some of the effect this has where it occurs.

An additional point to look for where a compiler has been developed on another machine is the size of memory it will handle without extra commands - because the IBM processors only look at memory in 64k chunks some compilers need you to add steps if you want to address memory further away than the 64k limit you're in.

To show just how fast the ST goes with the right language I repeated the sieve using register variables where the package supported it; when you look at the times remember that an IBM AT running Digital Research C takes 3.71 seconds and even a VAX-11/750 needs 2.41.

A mixture of standard routines were used for the benchmarks - the listings were as shown, with minor variations to accommodate the GST C.

**Empty** compiles a C program containing nothing but a null statement in order to see how big a program module is needed just for overheads.

**Sieve** is famous Sieve of Eratosthenes done 10 times for prime numbers up to 8190. Although the ST's 32 bits will take the search an awful lot higher this low value was chosen to allow comparison with weedy machines.

**Fib** is a Fibonacci series done 10 times up to the 24th value - again an old favourite in the benchmark stakes.

**Frame** performs a FOR loop 10,000 times.

**Float** performs some decimal point maths 10,000 times.

**Intmath** is a x10,000 looped series of integer arithmetic routines mixed with some bit-shifting.

**Pointer** uses C's powerful indirection pointers to set the value of a 128 character array 10,000 times.

**Savage** loops a bunch of trig functions 2500 times to check accuracy - in a perfect world the answer should be exactly 2500.

It is noted where a test was impossible to perform. Some comparisons were made with the ST Basic - where I managed to remain awake before a benchmark finished. Times are accurate to five milliseconds and to get them the ST's 68000 was put in to user mode in order to access the 200Hz system tick via a C pointer to protected memory at \$4BA.

See the Start routine listing for the details - this and an End routine were put into each benchmark as an include file and the program size figures thus include this code. All times are in

seconds and .PRG sizes in bytes. Compile times are for a complete compile and link cycle.

For a number of reasons it took longer to produce these results than it should have - my disc-based TOS was such an early version it kept bombing after repeated development cycles, my one double-sided drive was barely adequate - you really need at least two single-sided drives or one and a RAMdisc to compile with ease, then I had to add another half megabyte of memory to use a RAMdisc with a disc-based TOS. Once my TOS was a Version 19 in ROM I had no problems.

## Digital Research C

DR's C came as part of a preliminary version of the multi-disc Development Pack for the ST. It is expensive, about £400, but includes a pile of other information and software essential to the serious developer - not least of which is a full set of Gern documentation.

Although the other Cs had Gern functions in their library they didn't have this full documentation, probably because the mountain of paper needed takes longer to write than the compiler. Even so the DR paperwork left a lot to be desired in this incarnation. The pack didn't include an editor so the editor supplied with GST C was pressed into service.

Compilation is run by a batch program which invokes a three-pass compiler and then an

```
*****  
/* Sieve.c */  
*****  
  
#include "atdmc.h"  
#include "osbind.h"  
  
#define SIZE 8190  
  
char flag[SIZE+1] = {0};  
  
main()  
{  
    int i, prime, k, count, item;  
    #include "start"  
  
    for (item=1; item<=10; item++)  
    {  
        count=0;  
        for (i=0; i<SIZE+1; i++)  
            flag[i] = TRUE;  
        for (i=2; i<=SIZE; i++)  
        {  
            if (flag[i])  
            {  
                prime=i+1; i++;  
                for (k=i+prime; k<=SIZE; k+=prime)  
                    flag[k]=FALSE;  
                i++;  
            }  
        }  
    }  
    #include "end"  
}
```

The famous Sieve of Eratosthenes, run 10 times for prime numbers up to 8190

assembly stage. A further batch step allows linking to the libraries of C, GEM and floating-point functions, before producing a relocatable PRG module. Comprehensive error messages are available and a step for deleting intermediate files is included.

It was all a bit fiddly but produced compact, fast-running .PRGs, except while using the floating-point routines when the phenomenally fast times were revealed to be the result of incomplete implementation of the maths functions.

Single precision results were always produced when doubles had been requested, tan and atan functions weren't available, and even when they had been left out of the Savage benchmark it came up with a diametrically inaccurate result at least 1000 out.

Although I suspect later versions of the DR C will be improved my experience so far with ST Basic indicates similar results – suspiciously fast double precision arithmetic and wild inaccuracy on the Savage benchmark.

### Lattice C

Metacomco markets Lattice C, an established and widely used product for other machines, at £99.95 for the ST. It comes on two discs supplied with a clearly laid out and lucid paperback handbook and includes functions for Gem routines and for accessing GemDOS, TOS

and the BIOS, but these are less comprehensively defined than the standard C functions for the paper mountain reason. It comes with a screen editor employing a comprehensive set of commands.

A batch program is again used for the two-pass compiler which generates a list of messages when errors occur. There is an option to compile into a form which may either be linked

```
/*-----*  
/* Frame.c */  
/*-----*/  
  
#include "stdio.h"  
#include "osbind.h"  
  
#define COUNT 10000  
  
main()  
{  
    int i;  
  
#include "start"  
  
    for (i=0; i<COUNT; ++i)  
    {  
        i;  
    }  
  
#include "end"  
}
```

A FCB has performed 10,000 times

A Fibonacci series, done 10 times to the 24th value

10.022 Floating Point Calculation

by the Digital Research linker or by the supplied GST linker program. Development was very smooth and the fastest of the three packages tested. It needed less passes than the DR C and generated less intermediate files.

This is important if you are running your disc close to its maximum capacity — development stops with an *unable to open file XXX* type of message. Lattice was closest to the Kernighan and Ritchie language definition of the three tested, with almost imperceptible differences to standard C.

Program modules weren't quite as small as DR but they ran nearly as fast, even though Lattice used the ST's natural 32 bit integers compared with DR's (IBM-orientated) 16 bits. By declaring any *int* as a *short* in the Sieve Lattice shaved 0.6 seconds off. The change was even more spectacular with *Intrmath*, where the time was chopped by a factor of eight.

This was the only C under test where floating point was properly supported, so that I couldn't compare it with the other two. Accuracy was high on Savage at 2499.99999968363 and the

```
*****  
/* pointB.c */  
*****  
  
#include "stdio.h"  
#include "osbind.h"  
  
#define COUNT 10000  
  
main()  
{  
    int i,j,k;  
  
    #include "start"  
  
    for (i=0; i<COUNT; i++)  
    {  
        j=240; k=15;  
  
        j=j*(j/100);  
        j=j*(j/100);  
        j=j*(j/100);  
        k=k*(j/100);  
        k=k*(j/100);  
        k=k*(j/100);  
  
        j=j*(j/4); j=j-(k*(j/4));  
        k=k*(j/100);  
        k=k*(j/100);  
        k=k*(j/100);  
        k=k*(j/100);  
    }  
    #include "end"  
}
```

10,000 loops through some Integer math routines and bit-shifting

Float routine was at least two and a half times faster than comparable C on the Macintosh. I liked Lattice immensely.

## GSTC

GST's £59.95 budget package arrived the morning after I'd made a credit card order and, although service like this appears to be becoming more common it was fun to play with it before breakfast. At the time of writing GST was including a free Fractal generator written in C.

Despite being a limited implementation of C it is a version which is possible to get to grips with before the cornflakes. It uses a window-based shell program which allows you to carry out editing, compilation, assembly, linking and running a program from a command window to which you return at the end of each stage.

Conveniently it also automatically displays any program output in a window without you having to write the *Gem* stuff needed to set it up and keep it going. This saves a lot of hassle but the price paid is in the larger size of program modules needed.

It comes with loose-leaf documentation describing the separate parts of the system — some *TOS* and *Gem* routines were included, but like Lattice needed fuller explanation. The GST editor was the nicest to use — it felt like *First Word* without the fancy bits, and the *Pause on error* option during compilation was very useful for examining mistakes one at a time rather than

```
*****  
/* pointB.c */  
*****  
  
#include "stdio.h"  
#include "osbind.h"  
  
#define COUNT 10000  
#define ALLOCATED 128  
  
main()  
{  
    char *workarea=ALLOCATED, *ptr;  
    int i;  
  
    #include "start"  
  
    for (i=0; i<COUNT; i++)  
    {  
        ptr=workarea;  
        while (ptr<(workarea+ALLOCATED))  
        {  
            *ptr++ = i;  
            *ptr++;  
        }  
    }  
    #include "end"  
}
```

Using pointers to set up a 128 byte array 10,000 times

having to dump an error file to printer.

Although especially fast to compile in RAMdisc this was the least complete version of C but the handbook mentions that it will be enhanced "as a medium-term activity". Floating point and register variables were not available. Despite this it is a friendly way for the novice to begin getting to grips with the language without depleting the bank balance too much.

With all those windowing overheads the PRG modules were significantly larger on this C, and at times were slower. Declaring a 16 bit short in place of a 32 bit integer more than halved the Intmath time but only took 0.8 second off the Sieve.

There was no easy way to get the 68000 into supervisor mode in this C, so times are the average of three runs measured on a stopwatch with 0.05 second divisions. In the case of Frame I did a million loops and divided the result by 100.

## Conclusions

These products are aimed at different markets so there isn't really a best buy. I felt most comfortable with the completeness and speed of Lattice C but the GST suite's friendliness is a help if you're sticking a toe in the C for the first time.

The Development Pack allows every nook and cranny of the ST to be explored, but you must expect to lose a little sleep over it. The paperwork is essential reading if you intend to write something for the software top ten, but you might prefer to use another C, especially if floating point is needed. You pays your money and you takes your choice. ■

```
*****
/* message.c */
*****
#include "stdio.h"
#include "osbind.h"

#define ILOOP 2500

extern double tan(), atan(), exp(), log(), sqrt();
main()
{
    double x;
    int i;
    #include "start"

    x = 1.0;
    for(i = 1; i < (ILOOP-1); i++)
        x = tan(atan(exp(log(sqrt(x)))))) + 1.0;
    printf("x = %20.16f\n", x);
    #include "end"
}
```

The final test - complex floating point trig routines are tested 2500 times for accuracy

# NEXUS

## NEXUS EPROM DEVELOPMENT SYSTEM

The Nexus EPROM Development System is an EPROM simulator/programmer of enhanced capabilities. One is available now for the Atari ST range of computers. It plugs into the cartridge port and will allow you to:

- Develop ST cartridge software without ever having to program an EPROM.
- Use your ST as a professional 68000 hardware development system.
- Read EPROMs 16 bits wide or 8 bits wide (depending on target system architecture).
- Manipulate data between its 64K of EPROM simulation RAM and the ST's disk drive(s) and serial port in binary and a variety of hex formats.

Of far higher specification than probably any available dedicated EPROM programmer/simulator, amongst the system's features are:

Internal (ST) and external (target system) EPROM simulation with 64k of static RAM, the first ever true 16 bit simulator/programmer, LS and MS EPROMs programmed simultaneously in two ZIP sockets, automatic transparent 'split and shuttle', intelligent programming of all EPROMs 8k and above, SID style GEM window on simulation RAM or EPROMs including slider, icon manipulation etc, Edit, Locate a Value, Block Move, Fill/Clear, Checksums, Blank check, Program Check, Automatic or Manual Verify, External EPROM Simulation autonomous from ST operation, on-board Vpp generation etc. In the now envied Atari tradition of "Power without the Price" the cost of this remarkable system is £175.00. Included in this price is the highly professional GEM software and extensive comprehensive manual.

For delivery of your Nexus EPROM Development System by inter-  
of post and carriage P&P for £20.15 to include VAT. P&P is:

**Nexus Technical Services Limited**  
38 Melrose Avenue, Reading RG6 2BN  
Tel: (0734) 664559

Also available  
Stockists ST cartridge boards to take four EPROMs 8K or above (eg. 4 x 27256 = 128K)  
£14.75 Inc. VAT, P&P

Program: Time Bandit

Price: £29.95

Supplier: Microdeal, 41 Truro Road, St Austell, Cornwall. Tel: 0726 68020.

THE game is based around a race of Time Lords, the creators of the fabled Time Gates. As usual in these situations some of the all powerful beings are corrupt, and use the gates to their own ends, to achieve universal domination and amass unimaginable treasures.

For some reason best known to The Creators you, a Time Bandit, have been asked to go in search of these treasures. Suspecting that your motives are none too altruistic they have offered lots of cash in return for your help.

You can forgive the rather flawed and clichéd logic of the background and even the tacky introductory poem if the game is good fun, and it certainly is.

The game opens with a screen that presents various options – one or two player mode, keyboard or joystick and so on. The two player mode is interesting in that it allows either cooperation or feuding between two players.

In the one player mode the game occupies the left half of the screen and with two players each have their own half.

It is dangerously fascinating to watch someone else's action when you ought to be concentrating on your own play. If one bandit shoots the other the dead one can continue the game as a shadow, helping or hindering the offending player. Revenge is sweet, so I'll let you guess which of the two is the more likely.

The Time Gates are essential components of this game. Each one of the 16 contains 16 subsections, all of which must be completed to end the game.

To help you on your way the lands are strewn with pulsating keys. Once picked up these open, logically enough, pulsating locks. Every key will open one lock. When all are opened you can reach the mystical Way Out and the next phase of the adventure.

Game play is relatively simple – shoot anything and everything that moves. This is easy, and as they're all evil guardians you need feel no guilt anyway. Avoiding being shot is more difficult though.

Heroism and derring-do are rewarded with more cubits and often in my case, death. Every thousand cubits buys you an extra life. Is this game entirely based on capitalist principles?

Each gate takes you to a different time or dimension, where a new challenge awaits. Behind each lurk wild shoot-'em-ups, Pac-Man mazes, text adventures and beyond.

The authors, Bill Dunlevy and Harry Lafear of Michtron Inc have included a great deal of tongue-in-cheek humour, so boredom shouldn't be one of your problems.

Time Bandit bears a striking resemblance to

## Bandit should pass the test of time

the new arcade game Gauntlet, and no doubt draws some inspiration from this source. The scenery scrolls around you as you move, allowing the playing field to be many times the size of the screen.

It is very easy to get lost in some scenarios, especially with the presence of frustrating one-way doors, so map making is almost essential.

The characters and settings are colourful and fun, the action smooth and fast. It would no doubt be considered stunning on any machine other than the ST, but I'm sure things can get even better – a challenge perhaps?

One word of warning – the game will only run on an ST with a colour monitor. By doing this Microdeal has considerably reduced the market for this game, and if you are the unhappy owner of a monochrome monitor you will be disappointed.

Unless your powers of persuasion are sufficient to acquire a colour version for an evening, or you have the technical skills to work out some way of fooling the ST, Time Bandit will remain out of reach.

Microdeal has clearly put its paws on an excellent product. Just how well Time Bandit will stand the test of time against future products from companies like Rainbird is difficult to tell. I suspect it will pass with flying colours. ■
